# HAVANA SYNDROME: MEDICAL, SCIENTIFIC & POLICY PERSPECTIVES

Havana Syndrome is a descriptive condition involving a large cluster of U.S. government diplomats and family members affected by symptoms similar to PPPD, vestibular migraine, TBI, brain fog, headaches, hearing loss, and tinnitus. The UT Southwestern conference is the first and most comprehensive symposium from a medical/scientific perspective and includes distinguished speakers from the health policy world, U.S. government, media, and victim advocacy. The symposium will highlight the critical role of clinical and basic science research in understanding and treating victims of Havana Syndrome and other similar syndromes, and spotlight the importance of public-private partnerships between U.S. government entities and academic medical centers in addressing complex, 21st-century biomedical challenges.

## Agenda

February 10, 2022
